

Q36. MQTT vs HTTP comparison

Feature	MQTT	HTTP
Architecture	Pub/sub: a device "publishes" a message to a central hub, and others "subscribe" to get it	Request/response : a client asks for something, and the server gives it
Data transfer	Very lightweight; sends tiny packets of data	Heavier; sends more data (headers, etc.)with every request
Power	Very low; great for battery –powered devices	Higher; keeps the connection active longer , using more power
latency	Very fast(low latency)because it's always ready	Slower ; has to set up a new connection for every request
Best for	lot devices that needs to be always on but use little power	Browsing the web or fetching large files
security	Supports username/password and TLS encryption	Supports strong standard encryption(http/tls)
